Product Info

X-COLLAR

Until now, the marketplace has not offered a cervical collar with sufficient ability to adequately immobilise the head and cervical regions of a trauma patient. Research has shown that many collars currently on the market allow as much as 90 degrees of free movement laterally which may worsen existing injuries.

Currently, collar size must be approximated and set prior to application then removed and readjusted if not correctly sized or fitted in the first place.

The **X-COLLAR** addresses the common deficiencies and disappointments of other cervical immobilisation devices by allowing maximum immobilisation by securing the head and cervical region to the patient's torso.

Post application bi-lateral and vertical adjustments allow the **X-COLLAR** to better fit the patient's body type while reducing manipulation of the spine.

- ★ Enhanced immobilisation
- ★ Adjusts after immobilisation
- ★ Immobilises patients in position of comfort
- ★ Custom fits a broader range of patients
